

UI Grid Layout

FlexibleGridLayout – is a simple script which will help you create different sorts of UI Grids. It is similar to Horizontal or Vertical Layout Groups and controls behavior of the child objects.

How to use:

1. For using drag and drop to parent objects.
2. Amount of cells is determined by the number of children.
3. Change parameters in the parent object inspector to control cells (children) behavior.

Package includes the Demo Scene where you can play with the script before deciding to use it in your project.

Good luck and have fun!
